Q5 Project Planning & Presentation

20 marks

Present your project implementation plan including module breakdown, Gantt chart, technology stack, expected timeline, and future work. Demonstrate your initial prototype (if available) and answer the review committee's questions.

Q4 System Design

20 marks

Present the design of your proposed system by including any three of the following: • System Architecture , Datasets

Your Answer

This capstone project is a Java-based single-user desktop application that generates adaptive quizzes using topic-tagged question storage. The system delivers quizzes to the student, captures and records responses accurately, and performs automated scoring to evaluate the answers. It computes topic-wise performance for each quiz attempt and identifies weak areas by applying predefined rules based on the student's results. Using a lightweight rule-based adaptive model (instead of an IRT-based psychometric engine), the system generates adaptive follow-up quizzes that are weighted toward the topics identified as weak. Finally, it presents the student with a results dashboard that visually displays performance trends over time, helping the user track improvement and

Q3 Literature Survey

20 marks

Review at least five research papers related to your project. Prepare a comparison table showing the title, methodology, advantages, limitations, and research gap.

Your Answer

The existing classroom assessment approach mainly uses static quiz platforms like Google Forms and Kahoot, where every student gets the same fixed questions. This leads to several key problems: there is no personalization based on a student's performance, instructors must manually analyze results to identify weak topics (which is time-consuming and inconsistent), and there is no automatic system to detect topic-wise gaps. Even if weaknesses are noticed, these platforms don't provide adaptive follow-up quizzes that focus on the identified weak areas. More advanced adaptive methods like CAT with IRT can overcome this, but they require large calibrated question banks and complex psychometric modeling, which makes them difficult to implement in small or

Q2 Existing System Analysis

20 marks

Analyze the existing system related to your project. Explain the limitations, challenges, and justify the need for your proposed solution. Include at least three limitations of the existing system.

Your Answer

Existing System Analysis:

The existing system for classroom-based assessment relies primarily on static, one-size-fits-all quiz platforms such as Google Forms, Kahoot, and similar tools. In these systems, every student receives the same fixed set of questions regardless of their individual performance or understanding level. While these platforms are convenient for basic quiz delivery, they fall short when it comes to personalized learning and targeted academic support.

Q1 Project Proposal

20 marks

Present your capstone project proposal by explaining: • Project Title • Problem Statement • Objectives • Scope of the Project • Expected Outcomes Deliverables: 1. Project Proposal Document 2. PPT (5–10 slides) 3. Initial Architecture Diagram

Your Answer

Project Title: Adaptive Quiz System – An Automated Java System for Adaptive Quiz Generation and Student Weak-Area Identification

Problem Statement:

Traditional quiz systems are static in nature — every student receives the same set of questions regardless of their individual performance or understanding level. Instructors are required to manually review student results to identify knowledge gaps, which is
